

Plotting with ggplot2: Part 2

Computing for Data Analysis

What is ggplot2?

- An implementation of the *Grammar of Graphics* by Leland Wilkinson
- Grammar of graphics represents and abstraction of graphics ideas/objects
- Think “verb”, “noun”, “adjective” for graphics
- Allows for a “theory” of graphics on which to build new graphics and graphics objects

Basic Components of a ggplot2 Plot

- **A data frame**
- **aesthetic mappings:** how data are mapped to color, size
- **geoms:** geometric objects like points, lines, shapes.
- **facets:** for conditional plots.
- **stats:** statistical transformations like binning, quantiles, smoothing.
- **scales:** what scale an aesthetic map uses (example: male = red, female = blue).
- **coordinate system**

Building Plots with ggplot2

- When building plots in ggplot2 (rather than using qplot) the “artist’s palette” model may be the closest analogy
- Plots are built up in layers
 - Plot the data
 - Overlay a summary
 - Metadata and annotation

Example: BMI, PM_{2.5}, Asthma

- Mouse Allergen and Asthma Cohort Study
- Baltimore children (age 5-17)
- Persistent asthma, exacerbation in past year
- Does BMI (normal vs. overweight) modify the relationship between PM_{2.5} and asthma symptoms?

Basic Plot

```
qplot(logpm25, NocturnalSympt, data = maacs, facets = . ~ bmicat, geom =  
c("point", "smooth"), method = "lm")
```

Building Up in Layers

```
> head(maacs)
      logpm25      bmicat NocturnalSympt
2  1.5361795 normal weight           1
3  1.5905409 normal weight           0
4  1.5217786 normal weight           0
5  1.4323277 normal weight           0
6  1.2762320  overweight           8
8  0.7139103  overweight           0
```

```
> g <- ggplot(maacs, aes(logpm25, NocturnalSympt))
```

```
> summary(g)
data: logpm25, bmicat, NocturnalSympt [554x3]
mapping: x = logpm25, y = NocturnalSympt
faceting: facet_null()
```

Data Frame

Aesthetics

Initial call to
ggplot

Summary of
ggplot object

No Plot Yet!

```
> g <- ggplot(maacs, aes(logpm25, NocturnalSympt))  
> print(g)  
Error: No layers in plot
```

```
> p <- g + geom_point()  
> print(p)
```

Explicitly save and print
ggplot object

```
> g + geom_point()
```

Auto-print plot object
without saving

First Plot with Point Layer

```
g <- ggplot(maacs, aes(logpm25, NocturnalSympt))  
g + geom_point()
```

Adding More Layers: Smooth

```
g + geom_point() + geom_smooth()
```

```
g + geom_point() + geom_smooth(method = "lm")
```

Adding More Layers: Facets

Annotation

- Labels: `xlab()`, `ylab()`, `labs()`, `ggtitle()`
- Each of the “geom” functions has options to modify
- For things that only make sense globally, use `theme()`
 - Example: `theme(legend.position = "none")`
- Two standard appearance themes are included
 - `theme_gray()`: The default theme (gray background)
 - `theme_bw()`: More stark/plain

Modifying Aesthetics

```
g + geom_point(color = "steelblue",  
size = 4, alpha = 1/2)
```

Constant values

```
g + geom_point(aes(color = bmicat),  
size = 4, alpha = 1/2)
```

Data variable

Modifying Labels

labs() function for
modifying titles and
x-, y-axis labels

```
g + geom_point(aes(color = bmicat)) + labs(title = "MAACS Cohort") + labs(x = expression("log "
* PM[2.5]), y = "Nocturnal Symptoms")
```

Customizing the Smooth

```
g + geom_point(aes(color = bmicat), size = 2, alpha = 1/2) +  
  geom_smooth(size = 4, linetype = 3, method = "lm", se = FALSE)
```

Changing the Theme

```
g + geom_point(aes(color = bmicat)) + theme_bw(base_family = "Times")
```

A Notes about Axis Limits

```
testdat <- data.frame(x = 1:100, y = rnorm(100))  
testdat[50,2] <- 100 ## Outlier!  
plot(testdat$x, testdat$y, type = "l", ylim = c(-3,3))
```

```
g <- ggplot(testdat, aes(x = x, y = y))  
g + geom_line()
```

Axis Limits

Outlier missing

```
g + geom_line() + ylim(-3, 3)
```

Outlier included

```
g + geom_line() + coord_cartesian(ylim = c(-3, 3))
```

More Complex Example

- How does the relationship between $PM_{2.5}$ and nocturnal symptoms vary by BMI and NO_2 ?
- Unlike our previous BMI variable, NO_2 is continuous
- We need to make NO_2 categorical so we can condition on it in the plotting
 - Use the `cut()` function for this

Making NO₂ Deciles

```
## Calculate the deciles of the data
> cutpoints <- quantile(maacs$logno2_new, seq(0, 1, length = 11), na.rm = TRUE)

## Cut the data at the deciles and create a new factor variable
> maacs$no2dec <- cut(maacs$logno2_new, cutpoints)

## See the levels of the newly created factor variable
> levels(maacs$no2dec)
[1] "(0.378,0.969]" "(0.969,1.1]"    "(1.1,1.17]"    "(1.17,1.26]"
[5] "(1.26,1.32]"   "(1.32,1.38]"   "(1.38,1.44]"   "(1.44,1.54]"
[9] "(1.54,1.69]"   "(1.69,2.55]"
```

Final Plot

Non-default font

Multiple panels

Transparent points

MAACS Cohort

Smoother

Labels/Title

Code for Final Plot

```
## Setup ggplot with data frame
g <- ggplot(maacs, aes(logpm25, NocturnalSympt))

## Add layers
g + geom_point(alpha = 1/3)
  + facet_wrap(bmicat ~ no2dec, nrow = 2, ncol = 4)
  + geom_smooth(method="lm", se=FALSE, col="steelblue")
  + theme_bw(base_family = "Avenir", base_size = 10)
  + labs(x = expression("log " * PM[2.5]))
  + labs(y = "Nocturnal Symptoms")
  + labs(title = "MAACS Cohort")
```

Add points

Make panels

Add smoother

Change theme

Add labels

Summary

- ggplot2 is very powerful and flexible if you learn the “grammar” and the various elements that can be tuned/modified
- Many more types of plots can be made; explore and mess around with the package (references mentioned in Part 1 are useful)
